

# SCD – Smart Currency Detector Package for WCFM

By **GaJeLabs**

---

## 1. DESCRIPTION

SCD - Smart Currency Dectector is an extension for Wordpress/Woocommerce that brings to your e-commerce shop a smart end to end currency conversion functionality according to the end user's geographical location. The SCD module does much more than just convert currencies, it allows you to earn money by giving you the ability to manage currency fluctuations, simplify the payment process for the buyer by offering them the ability to purchase in their local currency, this is made possible by its compatibility with many payment gateways.

The SCD module is accompanied by several other extensions that provide cost effective and powerful features for e-commerce marketplace sites made with WCFM. The SCD modules for the wcfm marketplace offer the possibility for sellers to choose the desirable currency of their shop which can be different from the base currency of the platform defined by the administrator, so all the operations of visualization of sales statics, creation of products including taxes and shippings are done in the chosen currency.

The package thus made available to marketplaces on WCFM allows for better management of the platform in an environment where sellers wish to use the currency of their choice for the management of their shops and end users wish to buy in their local currency. The package contains several WCFM compatible extensions that facilitate the creation of simple, variable, booking and auction products as well as the allocation of tax and shipping costs.
